

Midland

What's happening right now in Midland Michigan and coastal India are good examples of what I've talked about in Climate Deadline 2035. Unfortunately, we are going to start to see an accumulation of climate related disasters overlaid on top of one another. (Right now, we have people trying to social distance while inside flood shelters!) When you combine that with dwindling resources and a synergistic interaction between disasters causing a non-linear acceleration in atmospheric warming itself the only possible solution will be and is deployment of already existing technology for removing carbon directly from the atmosphere. The only component missing is the will of human beings to organize behind this endeavor.

The danger behind giving money to organizations like the NRDC and the Center for Biological Diversity, etc. is that they are siphoning off the public will necessary to do this. People think they're actually doing something (which they would be if this was the 1970s or we were already passed the Climate deadline in the mid-20s 30s) but unfortunately all those efforts are going to be steamrolled over unless we get some form of land or ocean based direct carbon capture (Or possibly solar radiation management though this appears to upset too many people) set up.

As for me after completing the rewrite of Climate Deadline 2035 and with a legal brief submitted to the International Criminal Court there's not much more I can do without funding. Hopefully, you will have contacts and resources. What we really need are to get some folks with high visibility campaigning for direct carbon capture. I have discovered over the years you have to know someone who knows those people or you physically have to go to where they are and try to meet with them and for that you need financial resources. I've already spent all mine campaigning for this over the past several years.

So it's all hands on deck and good luck to everyone.
